

ABSTRACT

An agricultural device includes a base having one or more orifices to receive one or more pins of gardening tools. A latch is slidably attached to the base to detachably latch the gardening tool to the base, and to allow one or more gardening tools to be quickly changed or replaced with the other ones. A guide member may be secured to the base, to guide the latch to move relative to the base. A hand grip may be slidably attached to the base to operate the gardening tool. A stop may be secured to the base to guide the latch to move relative to the base. A spring may be attached to the base, to bias the latch relative to the base.
